

COMMENTARY TO HABILITATION THESIS¹

[Background: Crohn's disease (CD) is a chronic inflammatory bowel disease. Currently, we face a growing incidence of CD, mainly in developed countries. It is necessary, then, to find new and modern treatments (both conservative and surgical).

Methods: This habilitation thesis is a set of annotated works (a total of 23 scientific articles and 3 abstracts from international congresses). The articles were published between 2016 and 2020 and are supplemented and interconnected by an accompanying text with links to the latest literature.

Results: In IBD surgery, a mini-invasive approach is preferred. Surgically induced remission in patients with CD increases quality of life. The combination of oral ATB prophylaxis with preoperative orthograde bowel preparation appears to be an appropriate preoperative preparation before intestinal resection in patients with CD, to achieve minimal postoperative morbidity. Two or more mutations in the NOD2 gene are associated with a more aggressive type of CD, and these patients also require more frequent resection of the ileum than other CD patients. Early laparoscopic ileocecal resection in inflammatory disease behaviour is currently considered an alternative to Infliximab treatment. Positive microscopic inflammatory activity of CD in the resection margins in cases of ileocecal resection affects the early recurrence of the disease in the anastomosis. Perioperative use of confocal laser endomicroscopy (CLE) could be helpful in determining the resection line and reduce early recurrence of CD in the anastomosis. However, further studies with CLE in larger patient populations are needed.

Conclusion: A positive microscopic resection margin in ileocecal resection is a risk factor for early endoscopic recurrence, and CLE could be useful in the future to perioperatively determine the resection line and reduce CD recurrence.]

¹ The commentary must correspond to standard expectations in the field and must include a brief characteristic of the investigated matter, objectives of the work, employed methodologies, obtained results and, in case of co-authored works, a passage characterising the applicant's contribution in terms of both quality and content.
